

LITHIC IMPLEMENT

Unique ID: HAMP-E1FF33

Object type certainty: Certain

Workflow status: Awaiting validation

Middle Palaeolithic Levallois core, knapped from very high quality dark black flint. The core has two convex faces. The upper surface has a considerable amount of flakes removed, leaving a large amount of flaking scars and impact ripples on the surface. There are patches of natural mid-grey cortex surviving on the outer edges of this surface. The other face has a bulb of percussion and there is a hinged fracture along part of the outer edge. This surface has only been worked around the edge, the majority of the surface remaining smooth with the exception of a few small scars. There is a large patch of cortex covering just over one eighth of the surface, which extends from one edge towards the centre of the surface. The core is 121.6mm long, 78.25mm wide and 32.33mm thick.

Class: Core **Sub class:** Levallois
