

PERFORATED OBJECT

Unique ID: YORYM-05794A

Object type certainty: Certain

Workflow status: Awaiting validation

An incomplete stone perforated object, dating to from the Mesolithic to the Bronze Age (c.9,000-1,600 BC). The stone is broadly square in plan, but tapers slightly to a terminal with a worn break. A circular concave area is present on each side just before the break, resulting in the oval cross section narrowing at the centre. This suggests that the stone has been partially perforated. One indent has a dark brown patina on some areas. The other terminal is oval in cross section and also terminates in a worn break. Stuart Ogilvy (geologist) has looked at the stone and believes it is a siliceous sandstone with quartz grains. It is brown-grey in colour.

The object measures 32.49mm in length, 34.24mm in width at its widest, 20.35mm in thickness at its thickest and weighs 33.71g.
